

## HomeWork IT :

1. Create a private repo on github.
2. Create an app (web app) that prints the local IP to the browser (on HTTP - port 80) Use any coding language you want.
3. Create a load balancer based on a docker nginx image exposed on port 9090.
4. Create a docker compose that runs 3 instances of the app you created + the load balancer.
5. Open browser and check <http://localhost:9090>, verify you see different IP each refresh.
